

PRINCIPAL'S MESSAGE

The ABO blood group system is the primary classification used to categorize human blood based on the presence or absence of specific A and B antigens on the surface of red blood cells. It determines compatibility for blood transfusions and organ transplants. The ABO blood group system was discovered in 1901 by Austrian biologist and physician Karl Landsteiner. His foundational research into blood types and transfusions earned him the Nobel Prize in Physiology or Medicine in 1930. World Blood Donor Day is observed globally on June 14, specifically chosen to honour the birth anniversary of Karl Landsteiner. The primary goal of the day is to thank voluntary, unpaid donors for their life-saving contributions and to raise awareness about the constant, critical need for safe blood and plasma transfusions. This global campaign places humanity and compassion at the heart of every donation. The theme for this year "One Drop of Humanity. Give Blood. Save Lives." serves as a powerful reminder to all of us that donating blood is not just a clinical procedure, but an act of solidarity that creates a vital lifeline for people in need.
